South Korea is one of the rare countries that has experienced political industrial democratization and economic development simultaneously in a relatively short period. However, the full story of democratization and development processes displays two faces: positive and negative aspects to the deployment of labour human resources. This book explains these seemingly contradictory outcomes of Korean employment relations (ER) and human resource management (HRM) based upon a theoretical framework that incorporates logics of environmental constraints and strategies of actors during three key periods of the previous century: i.e. pre-1987, 1987-1997, and post-1997. The book discusses the paradigm shift in both ER and HRM. This much-needed text contains informative details on Korean ER and HRM of past and present with theoretical and practical views and of transformations and continuities. The book provides policy implications that will stimulate constructive debates regarding the mutual gains strategies for policy makers, management, and employees.

This book is devoted to the study of univariate distributions appropriate for the analyses of data known to be nonnegative. The book includes much material from reliability theory in engineering and survival analysis in medicine.

This thesis explores the effects of digital fabrication on the design, production, and customization of consumer electronic devices. It does so through a series of three case studies: a radio, a pair of speakers, and a computer mouse. Each case study combines a custom electronic circuit board with a digitally fabricated laser-cut or 3D-printed enclosure. For each case study, the thesis describes the construction and prototyping of the product and a workshop in which participants modified the design and made the device for themselves. This customization was enabled by the sharing of the design files for the products following the principles and practices of open source. The case studies are used to draw practical lessons about the application of electronics, the laser cutter, and the 3D printer in the digital fabrication of consumer electronic products. Implications are drawn for the open sourcing of each of these elements and for the software tools used to design them. The case studies also illustrate four modes of production that digital fabrication enables for electronic devices: one-off artisanal kit and a hybrid mass custom production. Additionally, they shed light on the types of customization and the human roles that digital fabrication implies for consumer electronics. Three main themes emerge: diversity in design and production, personal connection with devices, and leveraging of the power of software for the making of hardware.
